Sweets like Oreo, Pie and Tiramisu: Android Testing with QF-Test

With the release of QF-Test version 6.0, Android applications can now also be tested via QF-Test. Both on real devices and via emulator, the familiar functions and concepts of QF-Test can be used for testing mobile apps.

What do sweets like Oreo or Tiramisu have to do with QF-Test? The free software Android "sweetens" its various versions with these names. Android is the basis for apps on mobile devices from Samsung, LG and Google, among others.

Familiar user interactions with the touch display (swiping, changing orientation, confirming...) can be simulated for the tests - so the tests can be run on emulators, but also on real devices. The familiar workflow of QF-Test can also be transferred to Android tests: With the help of a recording window, you can record the interactions with your application and checks directly into a test suite, the control structure remains the same and component detection also works as usual.

A special recording window in QF-Test allows flexible recording of actions and checks independent of the use of emulators or real devices.

Another "candy" is added by QFS: This new version with Android support is free for customers who already use QF-Test with at least four other UI technologies.

This technical-financial "sweet stuff" goes down well for experienced users of QF-Test and QFS customers: „Having used QF-Test for many years, we were excited to learn that we could add our mobile solution to the QF-Test suite. We are still in the process of building the mobile suite, but in a short time we have been able to achieve great coverage due to the familiarity of QF-Test and competent support which is second to none. We have tried other tools, but this is the first where we have not had to tweak UI animations on the Android devices to fulfil our requirements for robustness.“ says Michael Eriksen, Senior Test Automation Specialist Systematic, Denmark.

Quality First Software: Tool QF-Test (www.qfs.de)

The company QFS (Quality First Software GmbH) is a German tool manufacturer with offices in the south of Munich and in Leipzig. With its product QF-Test, QFS has been firmly established in the GUI test automation market since 2001. Started as a professional testing tool for applications with Java Swing interfaces, QF-Test today also supports cross-browser web testing, JavaFX as successor of Swing, Windows, PDFs and Eclipse/SWT/RCP applications – all of them platform independent.

More than 1.400 customers in over 60 countries trust QF-Test, spread across all industries and company sizes. Customers especially appreciate the easy accessibility of the product for testers as well as developers, the stability and flexibility of the product as well as the fast and competent support in several languages.

The fact that working under the motto "Quality first" and "Family first" is fun is demonstrated by the multiple [awards](#) won by QFS (like Great Place to work®).
